

OLED vs MicroLED (vsdiff.com)

Feature	OLED	MicroLED
Brightness	Generally good, but may suffer from burn-in.	Higher peak brightness; no burn-in issues.
Color Accuracy	Excellent color reproduction.	Superior color range and vibrancy.
Black Levels	True blacks thanks to pixel-level illumination.	Also provides true blacks, similar to OLED.
Energy Efficiency	Less efficient when displaying bright content.	More energy-efficient, especially in bright modes.
Manufacturing Complexity	Relatively complex, leading to higher costs.	Currently expensive to produce, but could decrease.
Longevity	Susceptible to burn-in and degradation over time.	Longer lifespan with no burn-in issues.
